

ELASTOLIQULID REFLEX

WATER-BASED REFLECTING WATERPROOFING AGENT, FOR OLD WATERPROOFING ON EXPOSED ROOFS, FOR WATERPROOFING AND PROTECTING CONCRETE SURFACES

GRANTS *LEED* CREDITS

CHARACTERISTICS			ENVIRONMENTAL	METHOD OF USE				PRECAUTIONS
ONE-COMPONENT	WATER BASED	WATERPROOFING	ECO GREEN	MIX MECHANICALLY	SPRAY APPLICATION	APPLY BY BRUSH	APPLY BY ROLLER	STORAGE: KEEP AWAY FROM FROST

PROBLEM

- WATERPROOF COMPLEX-SHAPED CONCRETE SURFACES
- INCREASE THE THERMAL COMFORT OF THE INTERIOR DURING THE SUMMER
- REDUCE THE HEAT ISLAND EFFECT

Waterproofing and protecting complex-shaped concrete structures where the use of rolls of prefabricated polymer-bitumen membrane is difficult and where the presence of heat and naked flames increases the risk of fire.

SOLUTION

ELASTOLIQULID REFLEX is a ready-to-use elastomer waterproofing coating, made with synthetic polymers dispersed in water. After drying, ELASTOLIQULID REFLEX forms a tenacious film which adheres perfectly to the surface.

APPLICATION FIELDS

• RESIDENTIAL AND INDUSTRIAL CONSTRUCTION

ELASTOLIQULID REFLEX is ideal for coating and waterproofing concrete roofs. It is used for waterproofing concrete terraces and for protecting exposed bituminous polymer membranes. ELASTOLIQULID REFLEX is ideal for waterproofing terraces with floors made

of: concrete, bituminous polymer membranes protected with slate chippings or mineral grit. Its adhesion to old bituminous polymer membranes of bituminous coatings will depend on the age of the surface to which it is applied. When used on new bituminous coatings, you must apply PREPAINT to prepare the surface for ELASTOLIQULID REFLEX.

• LIVESTOCK SHEDS

The materials and system offered by Index contribute not only to the wellbeing of human users but also to that of livestock in intensive farming applications, which generally use lightweight shed roofs which transmit heat due to sunshine directly into the interior. In such cases, the surface to be treated may be made of sandwich panels, metal panelling, wood, fibre cement or asbestos panels.

ADVANTAGES

- Waterproofs complex geometries.
- Reflects sunlight
- The fluid product is not flammable.
- Good protection against aggressive airborne substances.
- Reduces the carbonation of concrete.
- Non-toxic.

METHOD OF USE

• PREPARING THE SUBSTRATE

The surface to be waterproofed must be clean and free of dirt and dust. Any holes, cracks or cavities must be filled in with RESISTO - INDEX (1) mortar; the slope of the roof, for allowing rain to run-off, must be reconstructed, if necessary.

• PREPARING THE SUBSTRATE

ELASTOLIQULID REFLEX must be carefully

mixed in the can before use. The first coat must be diluted 5-10% with water, depending on the type of surface and how porous it is.

(See following)

(See previous)

• APPLICATION

It can be applied with a brush, roller or spray gun (2). The surface must be sloping, to allow water to run-off and prevent water and dirt accumulating on it. For good protection, apply two coats in a crosswise pattern; apply the second coat after the first coat has dried. For surfaces subject to micro-cracking, you can reinforce the **ELASTOLIQUID REFLEX** coating by applying a layer of RINFOTEX unwoven fabric reinforcement between the two coats. This increases consumption by 0.5 kg/m².

• CONSUMPTION

The consumption of product depends on the nature and porosity of the surface and how thick you wish the waterproofing coating to be. On average using two or more coats, for a consumption of 1.5 kg/m², yields a 1.0 mm dried film.

• PRECAUTIONS

- It can be applied on surfaces subject to the occasional presence of stagnating water. The waterproofing must however be arranged appropriately to drain rainwater efficiently. Do not apply on very hot substrates because the paint filming process would be unduly accelerated with negative consequences on the cohesion and adhesion of the product to the substrate.
- Keep the containers sealed before use.
- Apply at temperatures between +5°C and +35°C. Extreme conditions of heat and cold must be avoided during application. Do not apply if the temperature is likely to drop below +5°C while the paint film is drying.
- Do not apply in very humid conditions or if it threatens to rain while the film is still drying.
- The product cannot be walked on except for routine maintenance.
- New, freshly applied bituminous surfaces usually have superficial 'outcrops' of hydrocarbons, which prevent the coating from adhering perfectly.

You are recommended to apply the product to the surface no earlier than 6 months after they have been laid, which should be long enough to eliminate such "outcrops". However this may not always be sufficient; we recommend treating the surface with PREPAINT before using the waterproofing product. If the surface is dirty, clean by brushing and washing with water. Should it be immediately laid on a new covering, the surface of the last layer must be slated or treated with PREPAINT prior to application.

- The product must be applied in combination with RINFOTEX reinforcement on bituminous polymer membrane laid over insulating panels.
- After use, clean tools with water and, if the product has already dried, we advise you to use white spirit or hot water to remove it.
- The product is subject to freezing; store at temperatures >+5°C.

Examples of livestock shed cool roofs

Metal roofs are very common, and corrugated fibre cement roofs are even more so; the latter are often made of asbestos cement which can be remediated with INDEX systems (see "Specification 12 – Rehabilitating asbestos cement roofs"). The roofs often also provide poor quality thermal insulation and combining reflective coatings with insulation increase the roof's performance even in the winter, by reducing its thermal dispersion. In upgrading livestock shed roofs the benefits of a cool roof are experienced by the livestock itself, which is affected by heat stress in the summer, since it is very difficult to control the micro-climate in the shed due to the metabolic heat generated by the animals themselves. This is an application of considerable economic importance, since heat stress in the summer can be injurious to the animals, degrading both their health and fertility, the quality and productivity of hens and the milk production of cows, as well as reducing the growth of rabbits, cattle and swine. for an example, see the following graphs, which show how the productivity of swine (20 - 90 kg), laying hens and milk cows varies with the ambient temperature.

For painting roofs which do not require REMEDIATION (in contrast with asbestos cement roofs): corrugated or trapezoidal metal panels, corrugated fibre cement panels or corrugated bituminous fibre panels, use **ELASTOLIQUID REFLEX ultrareflective coatings**.

BITUMINOUS FIBRE PANELS

Energy requalification of livestock shed roofs

The "Stability Law" 2016 (law n. 208, 28 December 2015) extended the tax deduction of 65% for energy requalification of buildings to 31 December 2016. From 1 January 2017, the incentive will be replaced by the tax deduction of 36% for restoration projects.

For thermally insulating corrugated fibre cement roofs, use ISOLONDULA thermal insulation panels, themselves protected by a slated waterproofing layer to which **ELASTOLIQUD REFLEX** ultrareflective coating can be applied.

For thermally insulating trapezoidal or corrugated panel roofs, use ISOLGRECA or ISOLONDULA, themselves protected by a slated waterproofing layer to which **ELASTOLIQUD REFLEX** ultrareflective coating can be applied.

Remediation of asbestos cement and energy requalification with cool roofs

For REMEDIATING corrugated asbestos cement roofs (pursuant to UNI 10686, March 1998, Annex 2, enacted by Decree on 20 August 1999, extension of the Law of 27 March 1992, n. 257.): Following encapsulation of the asbestos cement fibres with **ELASTOLIQUD PUR**, ISOLONDULA may be used for the OVERCOATING – TYPE C, itself protected by a slated waterproofing layer to which **ELASTOLIQUD REFLEX** ultrareflective coating may be applied.

TECHNICAL CHARACTERISTICS

	Standard	ELASTOLIQUID REFLEX
Appearance		Pasty liquid
Colour		White
Density	Internal Met.	15 000 ± 5 000 cps
Dry residue - at 130°C	UNI EN ISO 3251	78 ± 4%
Brookfield Viscosity	EN 2811-1	1.54 ± 0.10 kg/L
Storage in original packaging in a dry place, away from frost		12 months
Workability characteristics		
Application thickness		1.00 mm (in two coats)
Waiting time - for dust-free drying (*)		4 - 6 hours
Waiting time - till tack-free drying (*)		6 ÷ 8 hours
Waiting time - for total dry (*)		2 - 4 days
Application temperature		+5°C to +35°C
Application		manual or spray
Performance characteristics		
	Standard	Product performance
Class and type	EN 1504-2	C PI-MC-IR
Cold flexibility	UNI 1109	-25°C
Permeability to water vapour	EN 7783	Sd <5 m - class I
Adhesion test	EN 1542	≥0.8 MPa
Water absorption through capillarity	EN 1062-3	w < 0.1 kg/m²·h0.5
Permeability to CO₂	EN 1062-6	Sd >50 m
Solar reflectance	ASTM E-903	0.84
Solar reflectance - after ageing for 2 years		-
Emissivity in the infrared	ASTM C-1371	0.90
SRI (Solar Reflectance Index)		106 (**)
Tear resistance	NFT 46002	250 ±5%
Ultimate tensile strength	NFT 46002	1.0 ÷ 2.0 MPa
Thermal resistance - Working temperature		-10°C to +90°C
Hazardous substances	EN 1504-2	According note in ZA.1

Test conditions: temperature 23±2°C, 50±5% R.H. and air velocity in test area <0.2 m/s. **These parameters may vary based on the specific conditions of the worksite: temperature, humidity, ventilation, porosity of the substrate.**

(*) The stated times may be longer or shorter as the temperature decreases or increases.
